1. Create a File and Write Data

```
<?php

$file = fopen("test.txt","w");

fwrite($file,"This is a PHP file handling experiment.");

fclose($file);

echo "File created and data written successfully.";

?>
```

2. Create a File and Write multiple lines

```
$file = fopen("details.txt","w");

fwrite($file," Details\n");
fwrite($file,"Name: Rahul\n");
fwrite($file,"Age:23\n");

fclose($file);

echo "File created and details written successfully.";

?>
```

3.Read Data from a File

```
<?php
$file = fopen("test.txt","r");
$content = fread($file,filesize("test.txt"));
echo $content;
fclose($file);
?>
```

4. Append Data to a File

```
 <?php
$file = fopen("data.txt","w");
fwrite($file,"PHP Programming\n");
fclose($file);

$file = fopen("data.txt","a");
fwrite($file,"File Handling Lab");
fclose($file);
```

```
echo "Data appended successfully.";
?>
```

5. Check File Existence

```
if(file_exists("sample.txt"))
{
    echo "File exists";
}
else
{
    echo "File does not exist";
}
?>
```

6. Count Characters in a File

```
<?php
$file = "text.txt";
$content = file_get_contents($file);
$chars = strlen($content);

echo "Number of characters: ".$chars;
?>
```

7.Count Words in a File

```
<?php
$file = "paragraph.txt";
$content = file_get_contents($file);
$words = str_word_count($content);

echo "Number of words: ".$words;
?>
```

8. Count Lines in a File

```
<?php
$file = "notes.txt";
$lines = count(file($file));

echo "Number of lines: ".$lines;
?>
```

9.Copy Content from One File to Another

```
<?php
$source = "source.txt";
$destination = "destination.txt";
```

```
copy($source,$destination);

echo "File copied successfully.";
?>
```

10. Delete a File

```
if(unlink($file))
{
echo "File deleted successfully.";
}
else
{
echo "File not found.";
}
?>
```
