

## **EXP 14:File Handling in PHP**

### **Create a File and write Data into it**

#### **Aim**

To write and execute a PHP program to create a file, write data into it, read the contents of the file, and display the output using PHP file handling functions.

```
<?php  
// File name  
$filename = "sample.txt";  
  
// Write data to the file  
$file = fopen($filename, "w");  
fwrite($file, "Welcome to PHP File Handling.\n");  
fwrite($file, "This file is created and written using PHP.");  
fclose($file);  
  
// Read data from the file  
$file = fopen($filename, "r");  
$content = fread($file, filesize($filename));  
fclose($file);  
  
// Display file content  
echo nl2br($content);  
?>
```

### **DISPLAY CONTENTS OF FILE**

#### **Aim**

Develop a php program to display the contents of a file.

#### **Program**

```
filecontent.php  
<html>  
<head>  
<title>File</title>  
</head>  
<body bgcolor="#44AFF2">  
<h2>Contents of the file computer.txt</h2>  
<?php  
$myfile = fopen("computer.txt", "r") or die("Unable to open file!");  
echo fgets($myfile);  
fclose($myfile);  
?>  
</body>  
</html>
```

computer.txt
